

2.2.2 Professionalism Facts

As a PC technician, it is important to always act in a professional manner. Being professional will not only optimize the client's experience, but also dispel the myth that PC technicians have poor people skills. Consider the following guidelines when interacting with clients:

- Make a good first impression. If your first contact with the client is positive, the relationship will be much easier to handle and maintain.
 - Arrive to appointments on time and prepared. If you are going to be late, contact the client and let them know.
 - Dress professionally and following any company dress codes. This includes appearing well-groomed.
 - Greet the client and introduce yourself.
 - Ask permission before entering the client's office or home.
 - Address the client using the appropriate title.
 - Be sensitive to cultural differences between the two of you.
- Communicate effectively. Understanding both your and your client's expectations is very helpful.
 - Use clear, concise, and direct statements.
 - Ask the client open-ended questions so the client will talk about the issue and you can gather information.
 - Allow the client to speak and avoid interrupting.
 - Clarify client statements—restate what the client said and ask pertinent questions.
 - Take notes on complicated or important information.
 - Avoid using jargon, abbreviations, and acronyms. Take time to explain technical terms and issues in a simple way.
 - Clearly explain the problem and any repair options. Be sure to explain the advantages, disadvantages, and cost of a repair.
 - Set realistic expectations for finishing work—when in doubt, overestimate.
- Show respect. This includes showing respect not only to your clients, but also their workspaces and computers.
 - Never argue with a client or become defensive.
 - Avoid accusing the client. Even if the client caused the problem, do not point fingers.
 - Ask before moving items on desks or making changes to computer systems.
 - Stay calm and avoid being judgmental or insulting.
 - Avoid distractions or interruptions, including texting and social media notifications. Don't take personal phone calls. Ask permission before taking work-related calls.
 - Do not browse files on computers that are not necessary or related to the repair.
 - Never complain about clients on social media platforms.

Being professional extends to identifying the problem and implementing solutions. During this process, keep in mind the following:

- Get authorization to proceed before making any unexpected repairs or fixing items that were not part of the original problem, especially if the extra repairs result in an additional charge.
- After you have fixed the problem, try it out (or let the client try it out) to make sure that other problems don't exist.
- After the repairs are finished, provide the client with a detailed invoice of the work performed. Also include any manuals or documentation related to new hardware.

- Ask the client if they would like to keep the failed components.
- If necessary, take the time to briefly explain any new software or hardware that was installed.
- If applicable, offer additional services or training that might be beneficial to the client.
- If the problem is related to user error or is caused by actions taken by the client, tactfully explain the problem without accusing or judging the client.
- Before leaving, make sure the client is satisfied that the problem has been resolved. For best client service and based on your company policy, follow up with the client at a later time to verify that the problem remains fixed.

If a request is outside of your ability or responsibility, help the client get in contact with the appropriate resources, such as another technician or an authorized manager.
